Power Hour #3

This power hour is designed to practice Pandas Plotting and SKlearn with Python

There is no one correct approach to this case study.

Be creative and descriptive with your approach!

The tasks / objectives are in the comments of the cells.

Good luck and please ask questions if needed!

Step 1: Let's get some data

In [16]:
```
#Import the load_boston function that returns our data
from sklearn.datasets import load_boston

#Import the display function to vizualize the data
from IPython.display import display

#import pandas for data processing
import pandas as pd
```

In [31]:
```
#Import the data
dataset = load_boston()
```

In [32]:
```
#Look at the format of the raw data
display(dataset)
```

```
{'data': array([[6.3200e-03, 1.8000e+01, 2.3100e+00, ..., 1.5300e+01, 3.9690e+02,
         4.9800e+00],
        [2.7310e-02, 0.0000e+00, 7.0700e+00, ..., 1.7800e+01, 3.9690e+02,
         9.1400e+00],
        [2.7290e-02, 0.0000e+00, 7.0700e+00, ..., 1.7800e+01, 3.9283e+02,
         4.0300e+00],
        ...,
        [6.0760e-02, 0.0000e+00, 1.1930e+01, ..., 2.1000e+01, 3.9690e+02,
         5.6400e+00],
        [1.0959e-01, 0.0000e+00, 1.1930e+01, ..., 2.1000e+01, 3.9345e+02,
         6.4800e+00],
        [4.7410e-02, 0.0000e+00, 1.1930e+01, ..., 2.1000e+01, 3.9690e+02,
         7.8800e+00]]),
 'target': array([24. , 21.6, 34.7, 33.4, 36.2, 28.7, 22.9, 27.1, 16.5, 18.9, 15.

 'feature_names': array(['CRIM', 'ZN', 'INDUS', 'CHAS', 'NOX', 'RM', 'AGE', 'DIS',
'RAD',
        'TAX', 'PTRATIO', 'B', 'LSTAT'], dtype='<U7'),
 'DESCR': ".. _boston_dataset:\n\nBoston house prices dataset\n
```

```
----------\n\n**Data Set Characteristics:**  \n\n    :Number of I
```

In [33]:
```
#Extract the information we need from the result of load_boston()
col_names = dataset.feature_names
X = dataset.data
Y = dataset.target
```

Step 2: Explore our Data for Insights

In [35]:
```
#Create a DataFrame with our data
```

In [36]:
```
#View a couple rows of data
df.head()
```

Out[36]:

	CRIM	ZN	INDUS	CHAS	NOX	RM	AGE	DIS	RAD	TAX	PTRATIO	B	LSTAT
0	0.00632	18.0	2.31	0.0	0.538	6.575	65.2	4.0900	1.0	296.0	15.3	396.90	4.98

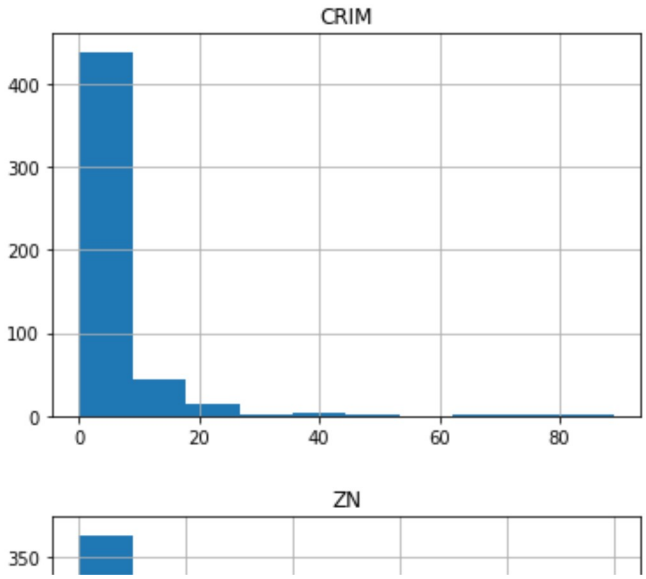
max	88.976200	100.000000	27.740000	1.000000	0.871000	8.780000	100.000000	12.126500	24.0000

In [38]:
```
#Vizualize the data in some way
import matplotlib.pyplot as plt

for col in df:
    df[col].hist()
    plt.title(col)
    plt.show()
```



In [ ]:
```
#Identify one insight from either of these methods
```

Step 3: Fit a model to our data

In [39]:
```
#Prep the data for training
#Divide into train and test sets
from sklearn.model_selection import train_test_split

X_train, X_test, Y_train, Y_test = train_test_split(X, Y, test_size=0.1, random_state
```

In [40]:

Out[40]:
```
(455,)
```

In [41]:
```
#Import and create an instance of our model
from sklearn.tree import DecisionTreeRegressor
price_tree = DecisionTreeRegressor(max_depth=4)
```

In [42]:
```
#Fit the model to the data
price_tree.fit(X_train, Y_train)
```

Out[42]:
```
DecisionTreeRegressor(ccp_alpha=0.0, criterion='mse', max_depth=4,
                      max_features=None, max_leaf_nodes=None,
                      min_impurity_decrease=0.0, min_impurity_split=None,
                      min_samples_leaf=1, min_samples_split=2,
                      min_weight_fraction_leaf=0.0, presort='deprecated',
                      random_state=None, splitter='best')
```

In [43]:
```
#Score your model performance on the test set
price_tree.score(X_test, Y_test)
```

```
0.7835537332288494
```

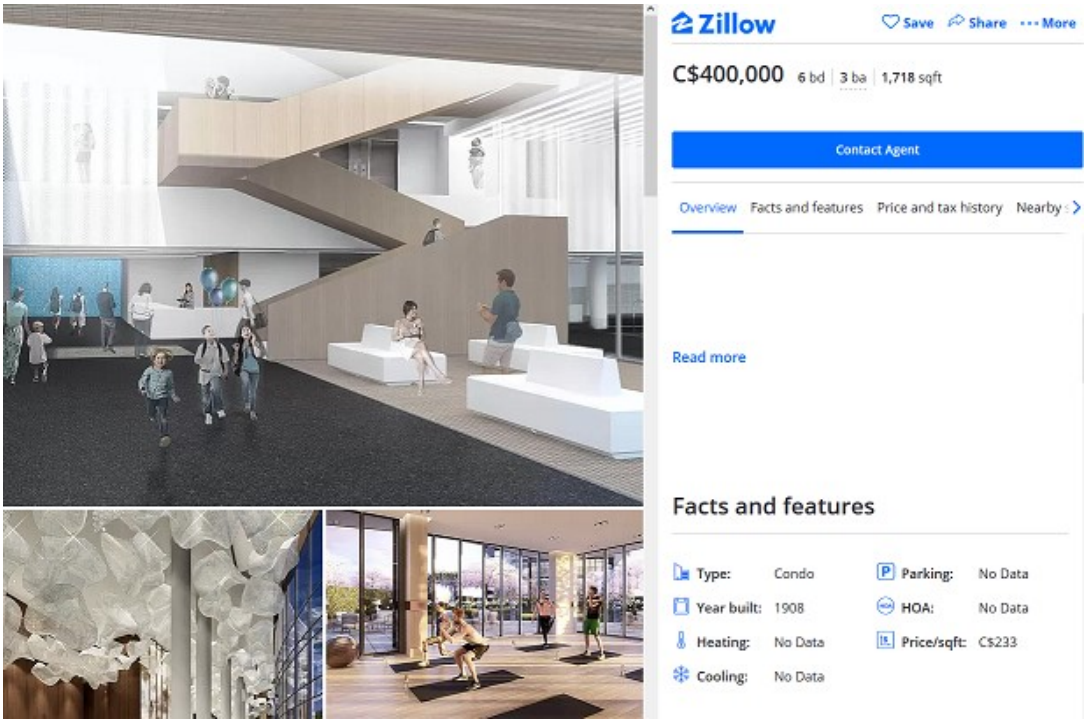
Step 4: Put it All Together

Let's see how this might work with user input

In [59]:
```
#Below is a listing you're asked to apply your model to
#You're given the input data for this listing in a variable called ex_house
#Find a way to obtain a prediction from our trained model and display that informatio

ex_house = [0.01538,90.0,3.75,0.0,0.394,7.454,34.2,6.3361,3.0,244.0,15.9,386.34,3.11]
```

```
Your house is worth an estimated $436285
```



In [ ]:
```
from sklearn.tree import plot_tree

#Visualize our tree
#Value is the number of samples per split
#The left branch is True and the right branch is False
plt.figure(figsize=(25,10))
a = plot_tree(price_tree,
              feature_names=col_names,
              filled=True,
              rounded=True,
```

In [ ]:
